

BridgeAI

Enterprise Business Analyst Copilot - Artifact 1

Introduction

BridgeAI is an AI-powered assistant concept created to support Business Analysts across the software development lifecycle. It focuses on communication, documentation, requirements analysis, and decision support while preserving human oversight.

Objective

To explore how generative AI can reduce repetitive Business Analysis work, improve documentation quality, and strengthen stakeholder communication without replacing professional judgment.

Process

I used a Design Thinking approach: empathize with Business Analyst challenges, define the core problem, ideate possible AI-supported workflows, prototype a custom assistant, and test outputs across multiple tools. I refined prompts and features through comparison and iteration.

Tools and Technologies

ChatGPT, Claude, Gemini, STORM AI, GPT Builder, and Google Docs.

Key Capabilities

Requirements clarification, meeting summaries, user-story drafting, stakeholder communication, process analysis, and structured decision support.

Value Proposition

BridgeAI demonstrates how AI can augment Business Analysts by saving time, improving consistency, and supporting clearer communication while keeping humans accountable for final decisions.

Unique Value

The artifact combines my Business Analysis background with emerging AI capabilities. Its distinguishing feature is its focus on responsible, user-centered adoption rather than automation for its own sake.

Relevance

The project is relevant to AI/ML coursework because it applies prompt engineering, model evaluation, human-AI collaboration, responsible AI, and iterative solution design to a real professional context.

Future Enhancements

Potential enhancements include Jira and Confluence integration, retrieval-augmented generation, workflow automation, analytics dashboards, and enterprise API integration.
